Examples of Problems

# **Problems vs. Algorithms**

This course focuses on analyzing the computational complexity of *problems* (not algorithms).

- ➤ A problem: an infinite set of possible instances with a question
- ➤ A decision problem: a question with a yes/no answer

**Example.** REACHABILITY:

INSTANCE: A graph (V, E) and nodes  $v, u \in V$ .

QUESTION: Is there a path in the graph from v to u?

#### Algorithm for REACHABILITY

```
S := \{v\}; \; \mathsf{mark} \; v;
\mathsf{while} \; S \neq \{\} \; \mathsf{do}
\mathsf{choose} \; \mathsf{a} \; \mathsf{node} \; i \; \mathsf{and} \; \mathsf{remove} \; \mathsf{it} \; \mathsf{from} \; S;
\mathsf{for} \; \mathsf{all} \; (i,j) \in E \; \mathsf{do}
\mathsf{if} \; j \; \mathsf{is} \; \mathsf{not} \; \mathsf{marked} \; \mathsf{then} \; \mathsf{mark} \; j \; \mathsf{and} \; \mathsf{add} \; \mathsf{it} \; \mathsf{to} \; S
\mathsf{endif}
\mathsf{endfor}
\mathsf{endwhile} \; ;
\mathsf{if} \; u \; \mathsf{marked} \; \mathsf{then} \; \mathsf{return} \; \mathsf{'there} \; \mathsf{is} \; \mathsf{a} \; \mathsf{path} \; \mathsf{from} \; v \; \mathsf{to} \; u'
\mathsf{else} \; \mathsf{return} \; \mathsf{'there} \; \mathsf{is} \; \mathsf{no} \; \mathsf{path} \; \mathsf{from} \; v \; \mathsf{to} \; u'
\mathsf{endif}
```

Examples of Problems

# Questions

How efficient is the algorithm?

How is it affected by

- ➤ Programming language?
- ➤ Computer architecture?
- ➤ Representation of the graph?
- ➤ Representation of the set S?

Given certain assumptions the algorithm terminates in O(|E|) steps.

#### Rates of Growth

Let  $f, g: \mathbf{N} \mapsto \mathbf{N}$ .

- ightharpoonup f(n) = O(g(n)) (f grows as g or slower), if there are positive integers c and  $n_0$  such that for all  $n > n_0$ ,  $f(n) < c \cdot g(n)$
- $ightharpoonup f(n) = \Omega(g(n)), \text{ if } g(n) = \Omega(f(n))$
- $ightharpoonup f(n) = \Theta(g(n)), \text{ if } g(n) = O(f(n)) \text{ and } f(n) = O(g(n)).$

**Example.** If p(n) is a polynomial of degree d, then  $p(n) = \Theta(n^d)$ .

If c > 1 is an integer and p(n) a polynomial, then  $p(n) = O(c^n)$  but  $p(n) \neq \Omega(c^n)$ , i.e.,

any polynomial grows strictly slower than any exponential.

If k > 1 is an integer, then  $\log^k n = O(n)$

Examples of Problems

# **Simplifying Assumptions**

The following simplifying assumptions are introduced when the computational complexity of problems is analyzed:

- ➤ A problem is *efficiently solvable* when there is an algorithm solving the problem such that the rate of growth of the solution time is polynomial w.r.t. the size n of the input  $(O(n^d))$
- ➤ A problem is *intractable* when no polynomial time algorithm available for it.
- ➤ Consider the worst-case performance (not, e.g., average case).

➤ Mathematical model of algorithms: Turing machines

Discussion

#### Possible criticism:

- ➤ Not all polynomial time algorithms are efficient in practice. There are efficient computations that are not polynomial. For instance, consider  $n^{80}$  vs  $2^{\frac{n}{100}}$ .
- ➤ Average case analysis is more informative than worst-case.

"Adopting polynomial time worst-case performance as our criterion of efficiency results in an elegant and useful theory that says something meaningful about practical computation, and would be impossible without this simplification."

Examples of Problems

### Further Examples

- ➤ Maximum flow
- ➤ Bipartite matching
- ➤ The traveling salesperson problem

### Maximum Flow

MAX FLOW

INSTANCE: Network N=(V,E,s,t,c), where (V,E) is a (directed) graph,  $s,t\in V$ , the *source* s has no incoming edges, the *sink* t has no outgoing edges and c is a function giving a *capacity* for each edge (each c(i,j) is a positive integer).

QUESTION: What is the largest possible value for the flow in N?

**Definition.** A *flow* is a function f that assigns for each edge (i,j) a nonnegative integer  $f(i,j) \le c(i,j)$  such that for each node (except s and t) the sum of fs of the incoming edges is equal to the sum of fs of the outgoing edges.

The *value* of the flow is the sum of the flows in the edges leaving s.

Examples of Problems

10

# Discussion

- ➤ MAX FLOW is an *optimization problem*.
- ► MAX FLOW(D) (decision problem) INSTANCE: Network N and integer K (goal/target value) QUESTION: Is there a flow of value K or more?
- ➤ MAX FLOW and MAX FLOW(D) are roughly equivalent.
- ➤ MAX FLOW is a nice example of a problem where the challenge was to find a polynomial time solution method.
- ➤ When "the *barrier of exponentiality*" was broken, more and more efficient polynomial time algorithms were developed  $(O(n^5),...,O(n^3),...)$

# **Bipartite Matching**

**MATCHING** 

INSTANCE: Bipartite graph B = (U, V, E), where  $U = \{u_1, \dots, u_n\}$ ,  $V = \{v_1, \dots, v_n\}$ , and  $E \subseteq U \times V$ .

QUESTION: Is there a set  $M \subseteq E$  of n edges such that for any two edges  $(u,v),(u',v') \in M$ ,  $u \neq u'$  and  $v \neq v'$  (is there a *perfect matching*)?

T-79.5103 / Autumn 2007

Examples of Problems

12

#### Reductions

➤ A reduction is an algorithm that solves problem A by transforming any instance x of A to an equivalent instance of a problem B (for which an algorithm already exists).

➤ An efficient algorithm for B provides an efficient algorithm for A if the reduction *R* from A to B is efficient.

# **E**xample

ightharpoonup MATCHING can be solved by a *reduction* to MAX FLOW: Given any bipartite graph B=(U,V,E), construct a network

where

$$E' = E \cup \{(s, u) \mid u \in U\} \cup \{(v, t) \mid v \in V\}$$

 $N = (V \cup U \cup \{s,t\}, E', s,t,c).$ 

and all capacities equal to 1.

 $\triangleright$  B has a perfect matching iff N has a flow of value n.

T-79.5103 / Autumn 2007

Examples of Problems

14

# The Traveling Salesperson Problem

**TSP** 

INSTANCE: n cities 1, ..., n and a nonnegative integer distance  $d_{ij}$  between any two cities i and j (such that  $d_{ij} = d_{ji}$ ).

QUESTION:

What is the shortest tour of the cities, i.e., a permutation  $\boldsymbol{\pi}$  such that

$$\sum_{i=1}^n d_{\pi(i)\pi(i+1)}$$

is as small as possible (where  $\pi(n+1) = \pi(1)$ ).

Decision problem TSP(D): is there a tour of length at most B (budget)?

## Discussion

- ➤ A naive algorithm for TSP: enumerate all possible permutations, compute the cost of each, and pick the best.
  - Not very practical: O(n!) tours, e.g. 10! = 3628800.
- ➤ For TSP no polynomial algorithm is known (despite very intensive efforts of developing one).
- ➤ Conjecture: there can be no polynomial-time algorithm for TSP.
- ightharpoonup This is closely related to one of the most important open problems in computer science: P = NP?

# **Learning Objectives**

- ➤ Ability to read and formulate decision/optimization problems
- ➤ Basic understanding of growth rates (polynomial vs. exponential)
- ➤ The idea of reducing one problem in another
